

The Los Angeles Dodgers Simplify IT and Improve Decision Making On and Off the Field

The Los Angeles Dodgers are a professional baseball team based in Los Angeles, California. The Dodgers are members of the National League West division of Major League Baseball (MLB). With a growing technology stack on their on-premises infrastructure, the Dodgers were looking to reduce complexity and become more technology-centric to allow them to reprioritize their focus on the experience that fans are seeing. They selected Cisco HyperFlex with Intel Xeon® Scalable processors and Intel® Optane™ technology. From ticketing to business analytics to baseball analytics, the new systems provide improved speed and responsiveness, simplify day to day operations and help the Dodgers make decisions in near real-time on and off the field.¹

“Intel Xeon Scalable processors are our key, because they are really giving us that performance that we need. Queries that we’re taking in some cases 12 to 18 hours, we are returning within 30 minutes. Cisco HyperFlex with Intel Optane enabled our analytics team to run their models 13 times faster.² And ultimately that allows us to win ball games.”

Ralph Esquibel, Vice President of Technology, Los Angeles Dodgers
